Languages Portuguese, native · Spanish, native · English, working proficiency

PROFILE	Full-stack developer building production web applications with React, TypeScript, Node.js and PostgreSQL. Five years of enterprise IT at Cognizant supporting corporate users across LATAM. Security is where I put my attention: authorisation enforced at the database rather than the interface, API keys that stay server-side, and integration tests that prove it rather than assume it.
STACK	Languages TypeScript · JavaScript · SQL · Python · HTML5 · CSS3 Frontend React · Next.js (App Router) · React Router · Tailwind CSS Backend Node.js · Express · REST APIs · JWT auth · Zod validation Data PostgreSQL · Supabase (Row Level Security) · Prisma · MongoDB · Firebase Practices Git & GitHub · Vitest · GitHub Actions CI · Selenium · pandas · Vercel · Postman
EXPERIENCE	Senior System Executive: Help Desk & Quality Cognizant · LATAM support team · Remote / 2021 to present - Built a Python + Selenium automation for a recurring ServiceNow request-submission task handled by a seven-person team at roughly 700 tickets a month. It reads the queue from a spreadsheet, fills and submits each form, captures the returned ticket number and writes the result back. - Designed it to survive a long unattended run: already-processed rows are skipped on restart, and a failure is recorded against its own row so one bad record cannot stop the batch. - Audit support interactions (calls, tickets and chats) against defined evaluation criteria, and write structured feedback the team can act on. - Provide technical support to enterprise users across software, hardware, operating systems, networking and business applications. - Identify recurring failures and propose process changes that cut rework across the support workflow.
PROJECTS	TicketSense: AI-assisted ticket triage Built twice, on two architectures, to compare where the server boundary belongs - Gemini classifies each ticket's category and urgency and suggests first diagnostic steps before a human opens it. - The comparison is the point: one version runs the AI call in a Supabase Edge Function, the other in a Next.js Route Handler. Both keep the API key server-side; the trade-off is documented in the repo. - Row Level Security enforces that a requester only ever reads their own tickets, at the database. React · Next.js 16 · TypeScript · Supabase · Gemini API · github.com/GabriellyFerreiraa/ticketsense-next Service Desk API REST API for a ticketing system, built from scratch - JWT authentication, request validation with Zod, integration tests (Vitest + Supertest) and CI on GitHub Actions. - Roles live in a dedicated table, never on the user record, a deliberate choice so a user cannot read their own role, edit it, and escalate. Node.js · Express · TypeScript · PostgreSQL · Prisma · github.com/GabriellyFerreiraa/servicedesk-api Desk Control: Service Desk operations tool Shift scheduling, absence approval workflows and task assignment - Role-based dashboards (Admin / Lead / Analyst) enforced through Supabase Row Level Security, so authorisation cannot be bypassed from the client. React · TypeScript · Supabase · Tailwind CSS · github.com/GabriellyFerreiraa/desk-control Payload CMS demo Headless CMS inside a Next.js App Router app: content model in TypeScript, stored in Postgres, read server-side through the Local API, so no API token sits in the render path. Next.js · Payload CMS · TypeScript · PostgreSQL (Neon) · Vercel
EDUCATION	Higher Technical Degree in Programming 2025 Teclab Instituto Técnico Superior, Argentina · state-authorised qualification Information Security 2025 freeCodeCamp · ~300 hours · HelmetJS, authentication, XSS / CSRF / clickjacking JavaScript Algorithms & Data Structures · Front-End Development Libraries 2025 freeCodeCamp · ~600 hours combined Full Stack Web Development 2023 Coderhouse · React, Node.js, MongoDB, Firebase
